

CONSTITUENTS OF BROMEPRO BLEND

BromePro is a unique blend, combining the features of the following varieties in a 50% Smooth and 50% Meadow Bromegrass combination:

Bravo Smooth Bromegrasses: **quality, persistence**

This variety consistently tops the list for yield and regrowth of smooth bromegrass in tests in Ontario and Québec. Bravo is very vigorous and persistent.

Manchar Smooth Bromegrass: **quality, persistence**

This is a western variety with excellent regrowth and persistence. Like Bravo it is a “southern” type –noted for aggressive growth. Manchar will only be used if there is a shortage of Bravo.

Paddock Meadow Bromegrasses: **quality, persistence, and regrowth**

This western origin grass has produced outstanding yield results in Ontario. It has very fast regrowth, actually re-growing from the cut or grazed stem. It is considerably less aggressive than smooth bromes and has fewer tendencies to spread.

BromePro™ Blend

Fuego Tall Fescue is a nutritious, leafy variety with excellent midsummer and fall production. It is very deep-rooted and drought tolerant.

Carnival Tall Fescue is a new variety that is very palatable and offers higher yields than Fuego.

Feeder Perennial Ryegrass has performed with excellent forage results in tests in Canadian trials. It germinates and establishes very quickly. Perennial ryegrass is a very nutritious forage grass that adds to the overall digestibility of the forage stand. The persistence of Feeder should lead to it persisting in the stand for the first 2-3 years of production.

OKAY Orchardgrass is a late maturing, very leafy variety. OKAY provides rapid regrowth allowing more grass in 2nd and 3rd cuttings.
