

For maximum genetic diversity and adaptation, each of Team's components are carefully screened and selected for their unique strengths that they bring to the blend.

DESCRIPTION:

Team is a turf-type tall fescue blend that contains some of the most widely tested and nationally recognized varieties available. Comprised of our top turf-type tall fescues, Team provides an improved turf with enhanced disease resistance, drought tolerance and low maintenance characteristics.

THE PLAYERS:

The Team members are chosen for their abilities such as turf density, dark green color, disease resistance and great persistence that bring overall turf quality to Team. With varieties such as Mustang 3, Blade Runner, and Crossfire II, you can expect a richer, darker green color, fine leaf texture and excellent environmental tolerance in this blend. All the varieties also have a high endophyte level, for great resistance to leaf and crown feeding insects.

SEEDING:

Team's toughness and good looks make it the ideal choice for use on home lawns, parks and sports fields. A seeding rate of 6 – 10 lbs. per 1000 sq. ft. is recommended. Seedlings should emerge in 7 – 14 days. A wide range of adaptability and pH tolerance (4.7 – 8.5) put Team right at home throughout the cool season turfgrass areas of the northern U.S. and the transition zone.

MAINTENANCE:

With Team, it's the combination that counts. For starters, Team requires only 3 – 5 lbs. actual N per year per 1000 sq. ft. to stay looking green and healthy. The irrigation requirements for Team are reduced too because of Teams' excellent drought tolerance, enhanced by a deep root system.
