

Glacier Timothy

What is it?

An early maturing timothy with excellent regrowth which is valued for two cut, compressed timothy production!

Why grow it?

Features		Benefits
Rapid stand establishment	➔	Aggressive seedlings ensure adequate plant populations for productive stands
Early maturity	➔	Ideal for two cut compressed timothy production
Excellent regrowth	➔	103-105% increase in regrowth compared to checks
Better disease resistance	➔	Increased stand longevity and hay quality
Excellent winter hardiness	➔	Suited to the harsh conditions of Western Canada

How to grow it...

Seeding Information	Adaptations	Management
Seed 3-5 lbs/ac	Adapted to wetter areas; capable of thriving under moderate spring flooding	To ensure longevity, do not cut or graze in the two week period prior to head emergence
Seed at ¼ to ½ inch depth into a firm seed bed	Tolerant to acidic soils; well suited to peat areas	For the best quality hay, cut prior to bloom (athesis)
Seedling vigour is good, with rapid stand establishment	Persistent with sufficient moisture	Fertilize according to soil tests; low fertility tolerated but nitrogen increases yield and protein
